

June, 2010 Press Release

Since 1997 EA Services has primarily been involved in Piping and Infrastructure repair in industrial and commercial facilities. A significant focus of the line of work has been the utilization of composite materials for reinforcement and rehabilitation of piping through a process of external application of materials. For years EA services has watched and investigated the technology of internal lining systems.

“While our business card says we do piping repairs, basically what we do is problem solve for our clients” says EA Services CEO Kevin Stern. And the problems most frequently left unresolved for years were the ones that had as their only resolution an internal lining system that provided structural reinforcement of the pipe as well as temperature and chemical compatibility.

Finally, after years of research and through some serendipity EA was introduced to Inspar Robotic Technologies. “We had a checklist of criteria that a system had to meet before we would introduce it into our client base, and Inspar had all the items check off for us” Kevin added.

EA Services quickly moved to become the 1<sup>st</sup> and for the time being only default contractor for the installation of the SIPP™ “sprayed in place pipe” system that Inspar provides. According to Kevin, “The response from our clients has been tremendous and the support from Inspar unparalleled. We are very excited to have found a solution for our clients pressing needs to restore integrity to corroded and damaged piping systems”
